

METHOD FOR REDUCING DC OFFSET ERROR FOR SINGLE ENDED AND DIFFERENTIAL SIGNALS

Abstract

5 A feedback signal generated as a function of a peak amplitude detected in an
input signal provides bias to reduce DC offset. A peak in the input signal is
compared with a selected signal level to align an output signal relative to a reference
signal level. The output signal is generated by comparing the reference signal level
and the biased input signal. Single ended signals are compared with a reference
10 level and differential input signals are compared with each other to reduce jitter.
